The AutoCAD software has now replaced the former Microstation software as the key product from Autodesk. AutoCAD can work with other software like Microstation. The main software supports AutoCAD 200, 300, and 300i. The key functions of the software are drafting and drawing, including two-dimensional (2D) and three-dimensional (3D) design, creation of perspectives, and rendering of 3D drawings. The main software supports AutoCAD 200, 300, and 300i. It is the standard software for the commercial design and drafting work. It has a wide range of users and the potential to increase in user base. It supports many other software like Microstation, PowerCADD, etc. If you are one of the professional designers working on this software, it is necessary to

Programming languages AutoCAD contains a software programming language named M, also known as Model-Centric Programming or M-centric Programming. It is a graph-based object-oriented programming language. It was first released in 1994, and AutoCAD M-based applications can be created in three languages: AutoLISP, Visual LISP, and C++/CLI. AutoCAD 10 introduced a fourth programming language called ObjectARX for the creation of object-oriented applications. AutoCAD's software development framework is known as the CAD-X Runtime Environment (CXR), which is a set of tools to help users create or extend AutoCAD functionality or to access or manipulate CAD data, as well as an online repository to share such applications. The latest version of CXR is CXR 10, which was released on October 20, 2019. It includes the following tools: Application Builder – A tool to create projects using standard parts provided by the user, which are templates from which applications are created. Code Navigator – An editor to author code and view code. Help – A utility to create tutorials, documentation, and help information, to include Web Help, Quick Help and existing Help systems. Plugin Factory – A tool to create plugins (add-on applications) for AutoCAD. Script Editor – A tool to create and edit scripts that operate in the CXR runtime environment. The user types in a script using the Java language, using blocks (and variables) which are objects, and which are different than M-based objects. It allows the user to create and manage collections of functions and scripts to operate in the runtime environment. Template Library – A tool to create standard parts for various objects (e.g. blocks, text, dimension, tables, and so on). A software development kit (SDK) for CXR 10 was released on October 13, 2019. This SDK supports a variety of programming languages and libraries, including AutoLISP, C++, ObjectARX, and Visual LISP.
