COPYBOOK ENCODER is a utility that will enable you to get a CopyBook from a file containing a list of CopyBooks and corresponding CopyBook Identifiers, which will be written to a new.COB file. User Review For Programmers The COPYBOOK ENCODER utility is a quick and easy way to extract CopyBooks from a set of flat-file data. With this utility, you can load your Flat File into a CopyBook and convert them to new CopyBooks. CopyBook ENCODER will do all the work for you and allow you to keep working in a neat, small and easy-to-use program. Programmers often have large amounts of data that is stored as flat files on their computer. They may have hundreds of files in many different directories or locations and would like to group these files by category, by subject, by type or by anything else they can think of. For example, programmers may want to keep track of all their IDE files, all their COBOL Copybooks and a few other files. In order to organize these files, they may want to make one CopyBook file for each category. Or, they may want to make a separate CopyBook file for each COBOL Copybook. There are many different ways to organize these files. CopyBook ENCODER helps them to do just that, while keeping their programs neat and small. If you have very little experience with COBOL CopyBooks or flat files you may be new to the whole idea of copybooks and data files. We think it is important to understand the basic concepts and the various steps CopyBook ENCODER will take for you. Before we begin, you must have an OpenOffice.org install (version 1.5 or newer) on your system. We will be using OpenOffice.org Calc and Import/Export which comes as part of OpenOffice.org. To begin, simply open your favorite text editor (Notepad in Windows or Emacs or Vi in Unix) and create a file. For example: The contents of the file will contain the CopyBooks you want to have your program analyze. CopyBook ENCODER reads this file line by line and looks for the copybooks mentioned. The format of a COPYBOOK line is: Where is the name
