In addition to simplifying complex systems, Windows operating systems have become a target for cyber criminals. The aim of such hackers is to steal data, conduct denial-of-service attacks or to create devices, such as keyloggers or Trojan horses, to collect personal information or launch other

malicious activities. KeyMacro lets you create Windows shortcuts that activate scripts which can be run directly from the Windows taskbar and display a message that is easy to identify and that will give you clues on what's happening on the compromised PC. It's up to you to decide what exactly to do with the data collected by the script. The program lets you keep it all for yourself or share the collected information with friends and family. If you have just one compromised PC and don't want to spend time on a daily basis monitoring its activities, KeyMacro is the tool for you. KeyMacro Review: The program's interface is somewhat complex, but the program itself is dead easy to use. The controls are set up to a grid, as the process of creating a shortcut requires at least five or six steps, starting with selecting an object from the list on the left, picking the desired location in the location list on the right, giving it a

name, a target path, creating a shortcut and selecting the kind of shortcut you want to create. In the end, you get a button that launches the script or executes another shortcut, while the program displays the information you collected in the system log. Users often don't know exactly what they do with their keystrokes as they often unintentionally press the wrong keys. So KeyMacro sends a message to the display and sounds an audible signal to warn you that you've done something wrong. You can cancel the script if you don't want to proceed and you can cancel the shortcut if you don't want to perform the action. You can configure a delay in seconds before launching a script and you can configure how many times the message displays before the script runs. Data collection is done in the background, so you don't have to be too worried about privacy as the data is not stored in the system registry. You can

also use KeyMacro to create secure shortcuts and make your online purchases from reputable web sites. KeyMacro Review: KeyMacro allows you to configure your shortcuts with the ability to execute scripts in the background. But you have to carefully select the operating system you are going to install the program. The program is not supported on Windows XP, Windows 77a5ca646e

It comes in handy whenever you want to leave the computer unattended while it's carrying out lengthy tasks, such as downloading large files, but also to shut down when it's done, particularly if other people

have access to your password-protected PC. Prerequisites and interface The whole program's packed in just one executable file that can be saved anywhere on the disk or copied to a removable storage unit, in order to seamlessly launch it on any computer with little effort. It doesn't add new entries to the system registry or create files on the disk without letting you know about it. However, you must have.NET Framework installed, as it was built with the aid of this platform. ShutDown adopts a slightly unusual interface, putting emphasis on graphical elements to make the window look hi-tech. The preferred PC power type action can be selected between shutdown, restart or log off, either from the "Options" menu or by clicking on two arrow buttons to navigate all panes. Set computer shutdown, restart or log off at a sharp time The utility reveals the current time in 12-clock format

(AM/PM) and asks you to set the preferred time to trigger the action at. It doesn't show the remaining time, nor does it bring up a message dialog to the screen to let you know that time's almost up and to offer you the possibility to cancel the task if you forgot about it and changed your mind. The main window can be minimized to the taskbar, as there is no option implemented for sending it to the system tray. Evaluation and conclusion We've come across some discrepancies concerning GUI aspects in our tests, probably because the application hasn't received updates for a long

Evaluation and conclusion The program is simple to use and can be handled by most of its target audience. The only drawback is that it doesn't offer any interactive message dialogs that allow you to cancel the task if you change your mind. There's also a lack of an option that enables you to schedule the migration to a specific day and time of the day.
