A: As reported here and here, the numbers plugin is not working, because some of the numbers are rendered as texts, which breaks the code. With 4Media Video Converter Ultimate, you can fix that with the following simple command line: 4Media Video Converter Ultimate: -Hildred Make sure you run this command as administrator. import { shallow } from 'enzyme'; import React from 'react'; import Stack from './'; jest.mock('./pvwx'); const testComponent = () => shallow(); describe('Stack', () => { it('should not change a height or width of an element', () => { const wrapper = testComponent(); expect(wrapper.prop('height')).toBe('80'); expect(wrapper.prop('width')).toBe('100'); }); }); Q: Conditional logic with if statements in bash I am writing a bash script, in which I have an if statement: function say() { if [ "\${1}" = "foo" ]; then echo "foo" elif [ "\${1}" = "bar" ]; then echo "bar" else echo "other" fi } I want to now say, if in my script it is \$1 is foo, then perform this function, but if in my script it is \$1 is bar, then not perform the function. How can I do this? A: read should work: #!/bin/bash read -p "Do you want to do something? " if [ "\$REPLY" = "Yes" ]; then echo "foo" elif [ "\$REPLY" = "No" ]; then echo "bar" else echo "Other" fi But if you want to refer to a variable other than \$1, then you need to use an array: #!/bin/bash declare -a option\_strings read -p "Do
