The biggest problem with Lightroom 5 is that it has a lot of small bugs and issues that may make it unusable for many people. Obviously, it's still in beta. For example, someone reported that there is no camera calibration, meaning that crops may show underexposed or overexposed areas in the final image. When clicking through to the full image, the highlight is -2 instead of 3, which appears to be image space -14. I didn't have this happen to me, but I didn't want to take a risk. I just upped my Trusty Old App to #6, and made no changes to Lightroom. If this happens to you, you may want to downgrade your trusty old app. Nutshell:
Lightroom 5 is very near production release. It's a final, solid release, albeit beta software. You may want to test the software on a secondary computer to determine if it's a viable upgrade for you. It's text book beta software, so even if you hate using beta software, you've got to use it to help identify bugs. My advice would be to keep using the beta version until it's released. You may not like it, but it's the only way to find out what's broken and where it's broken. It might take Adobe months to fix what I find, but you'll have the peace of mind of knowing that when it does happen, it will be fixed. Also, the Mac version of Lightroom 5, Lightroom on the Mac App Store version, will be updated to version 6.6 in a few months, as is the case with other versions of Lightroom. Once available, you may download Lightroom 6.6 free.
