The 101 Aarons Crash Course in Webcomics: They're that good!The present invention relates generally to vehicle power seats, and, more particularly, to a power seat assembly having a recliner mechanism which provides an actuation force to one or more powered devices within a vehicle. It is known in the related art to utilize power seats to position a vehicle occupant relative to the vehicle seat. One example of such a power seat is shown in U.S. Pat. No. 5,542,269, the entire disclosure of which is incorporated herein by reference. This power seat includes a seat assembly having a slidable seat back and a seat bottom connected together by four coupling rods. The seat bottom includes a seat bottom pad, and is adapted to be retained between a base frame and a bolster frame. The bolsters are each mounted to a respective side of the base frame. One end of each coupling rod is pivotably coupled to the seat bottom pad by means of a pivotable connection. The pivotable connection includes a pin which is received through an opening in the seat bottom pad and a corresponding opening in the coupling rod. The pivotable connection also includes a lever having a first end which is pivotably coupled to the pin and a second end which is coupled to a drive rod. The drive rod is coupled to a pair of oppositely disposed driveshafts, one of which is coupled to a first main drive gear. The other drive shaft is coupled to a second main drive gear which is typically rotatably driven by a main motor. The main motor is operably connected to a remote control device. The remote control device is coupled to the main motor and to a microprocessor such that when the main motor is activated, the microprocessor controls the flow of current to the main motor via a field-effect transistor (FET). As such, when the main motor is activated, a suitable current is directed through the main motor, thereby rotatably driving the second main drive gear and consequently, the second main drive shaft to rotate the two main drive gears about a common axis. In this manner, the main drive gears are actuated in unison. Since the
