Molecular phylogeny of the diverse eukaryotes. The taxonomic distribution of eukaryotes demonstrates a lack of clear boundaries between organisms within groups. By using as broad a representation of eukaryotes as possible, we can explore their phylogenetic relationships. To do this, we used sequences from the nuclear 18S rRNA gene and ribosomal protein genes, as well as a mitochondrial CO1 gene fragment, to examine the taxonomic distribution of eukaryotes. The data from these genes were combined with over 6000 other sequences obtained from complete or partial 18S rRNA gene sequences for phylogenetic analysis. With the use of the neighbor-joining method, we resolved a robust tree that includes eukaryotes from every group at the rank of kingdom, phylum, class, order, family, genus, and species. Within each of these groups, we identified subsets of groups that appear to have close phylogenetic relationships. In some cases, these subsets can be clearly differentiated by the use of different genes. We are proposing a conceptual framework of eukaryotic evolution that uses this set of phylogenetic trees. Within this framework, we predict that horizontal gene transfer will play a major role in the origin of protists. Additionally, this framework predicts a multicellular origin for eukaryotes from a common ancestor. Finally, we use the phylogenetic trees to establish a preliminary taxonomy of eukaryotes, which we believe is a first step in providing a reference for experimental work on the biology and genetics of eukaryotes.Gold-catalyzed [3 + 2] cycloaddition of alkynylacetylenes and cyclic enones: diastereoselective construction of highly functionalized chiral α,β-unsaturated lactones. A convenient approach to highly functionalized α,β-unsaturated lactones has been developed. High diastereoselectivity was observed in the gold-catalyzed [3 + 2] cycloaddition between alkynylacetylenes and cyclic enones, which provides an effective way to synthesize a series of highly functionalized chiral α,β-unsaturated lactones.Q: Remove lines matching a pattern that are at the end of a file I want to remove lines matching a pattern that are at the end of a file.
