We study here the slow-mode-wave (SMW) instabilities in a discrete nonlinear Schrödinger model, one of the simplest that supports SMW modes. By starting from a discrete wave equation for nonlinear optical pulses in a rotating frame of reference, we introduce a minimal discrete model with two degrees of freedom. We show numerically that the model exhibits two distinct regimes for the SMW instabilities. The onset of these modes is found to occur through an explosion of a spatiotemporal chaos embedded in the system of adiabatic mode wave equations. This explosive behavior is in the spirit of the catastrophic intermittency found for the so-called Berezinskii-Kosterlitz-Thouless (BKT) model and this explosion shares important features with the so-called continuous limit of the BKT model.Q: How to access MPMoviePlayerController's trackDuration properties?
