Using the facile solid-state reaction of AgNO_3 and Sb or Sn or Pb, three new Ag(2)-based chalcogenides, i.e. $\text{Ag}(2)\text{SbSe}(3)$, $\text{Ag}(2)\text{SnSe}(3)$ and $\text{Ag}(2)\text{PbSe}(3)$, have been successfully prepared. Among the three compositions, $\text{Ag}(2)\text{SbSe}(3)$ displayed the best luminescent properties due to the large energy gap of 3.38 eV, which can extend the light-absorption in the near-infrared region to the near-ultraviolet. The $\text{Ag}(2)\text{SbSe}(3)$ crystal structure consists of the space group $\text{Fm-}3\text{m}$ (167) (No. 243), consists of $\text{Ag}(2)\text{SbSe}(3)$ polyhedra, and the obtained crystal structure can be described as different polyhedral with the new structure of $(\text{Ag}(2)\text{SbSe}(3))(0.5)(\text{Se}(2)\text{S}(3))$. Association Between the Frailty Index and Performance Status in Patients with ST-Elevation Myocardial Infarction Treated with Primary Percutaneous Coronary Intervention: The PROMISE-Frailty Trial. Frailty is a clinical state in which patients have an increased risk of adverse health outcomes because of their weakened physiological reserves. In patients with acute coronary syndrome, frailty predicts increased mortality and morbidity and has been associated with increased length of stay and adverse events in the perioperative period c6a93da74d
