Therefore, since the method that the DES Cracker Project used to break DES can be applied to other (so-called) block ciphers, it can be used to break other block ciphers for which an appropriate implementation exists. Over time, the DES crackers' success with DES has made it more difficult for the other 8.3 "EAST" crypto systems to be cracked. DES is being phased out by the US government in favor of the AES cipher which is a successor to DES. A 56-bit DES key (e.g., using a 56-bit key length and a 128-bit key) is only about a thousand times slower than a 256-bit AES key, and an 8-byte DES key is about three thousand times slower than an 8-byte AES key. Instead of using the two key derived from one secret, one key is changed to one derived from a secret and then the key from another. The result is an encryptor function that looks like a very thin implementation of this process. This approach is known as an "invertible loop function," invertible means that two encryptions using the function will always give the same result. This is because the output is the input encrypted with a key derived from another secret key. This loop function is called a "one-way function," because it is an easy method of proving that two inputs are the same. In addition, the use of this function makes the application binary compatible with older versions of Windows. (This makes the function less useful to the attacker, as older versions of Windows were not compatible with the loop function; thus, it could not be used to break through the software itself). 5ec8ef588b
