After trying out Photoshop for about 1.5 years I've been seriously considering switching to the Apple suite. While transition seems painful, there definitely have many advantages compared to the Adobe package, especially with the Mac ecosystem and the way Apple seems to be moving forward. Right now, I'm considering converting to the new MacBook Pro 15" with the 3420M. The truth lies in the vast capabilities of this program. However, we should not take all of these tools and functions and add them to Lightroom. I know that the in-app features of Lightroom are available in Photoshop CC, but for some reason, I do not like Lightroom and thus, would not like to pull Photoshop away from what it does best. Rather, I would prefer to have heavy Photoshop keyboard shortcuts mapped to simple Lightroom keyboard shortcuts. Lightroom, because of its familiarity, also allows me to completely avoid complex Photoshop editing methods and processes that I dislike too much. The role of the modern artist, illustrator, or photographer is not only to create magnificent pieces of art or create stunning photographs. He or she is also expected to be a stock photographer or Photoshop expert, a blogger, a videographer, or a designer of some sort. More and more people are turning to the internet, social media, and various platforms to host and share their content, and Photoshop seems to be ever more popular as a means to create all of these. It seems that Adobe is also truly a full-fledged social business that gives users a benefit of using one service for all of their needs!

Crop is the first tool in the post-crop overlay selection that we have come across. For example, Photoshop fills in borders after selecting a section for you. Sometimes it's useful, sometimes it's not. If you want to select a few sections, then crop, you'll be doing so with no tooling. And it's the first time this tool is available in the CS series. If you make extensive custom selections and layers, then you'll be glad to know that you can now dismiss a section by using the shortcut LFT + spacebar. No, this isn't an UI change, but it is a shortcut that is coming to the UI. This will help reduce tedious actions when you have specific areas to add/remove layers for. This will make you reconsider using content masks. But, in case you already use them, content masks can now be linked between multiple timeframes. So, if you use a content mask thumbnail and want to reuse it in the future, it will be possible. Of course, you will have to go through every sequence and edit it. The immediate and smooth UI changes that we've seen on the iOS side. Not only will the user experience be different from Android, but they're also really pretty and they look consistent

between the two. It's like a breath of fresh air. The other big gripe I've had is the status bar. Now, it's less distracting, and it doesn't go away when dragging. Sometimes when you're dragging, there will be a status bar on top, which can get pretty distracting.
