Chemical Agency announced that a man who worked as a dust collector in a pesticide manufacturing plant in northeast China's Hebei Province died on the afternoon of June 3. According to reports, the man was struggling for air outside one of the windmills on a glass of pesticide in the course of cleaning a cart, when he inhaled its pesticide mist. Six days later, the man succumbed to brain cancer, revealing the high toxicity of chlorothiazole. The death has aroused public concern over the recent spike in toxicity and pollution of pesticides in China. Three weeks ago, a man died after his urine had been trapped in a keg of pesticide for over a month. Reports suggest that such cases are on the rise. One day last month, a man on the train working in a city named Gulu in the northeast province of Liaoning took a breath of an unknown pesticide on a Sunday afternoon at around 4 p.m. He died soon afterwards. Another three days later, another man died of acute organ failure after inhaling an unknown pesticide mist. The Ministry of Environmental Protection (MEP) announced that six types of pesticides had been found in a sample of water in the Gulu city reservoir. Chemical Analysis Center of the Hebei Provincial Environmental Monitoring Centre confirmed that the pesticide contained chlorothiazole, which has been listed as being toxic to the liver, kidney and central nervous system of the human body. Chlorothiazole is a pesticide compound that has been on the market for over a decade, and has been imported to China from abroad as early as 2002. It is mainly used for combating pests in farming crops, including rice, wheat and tobacco. It has a distinctive odor, and its use has been prohibited by the MEP since 2006. Chemical expert Li Yulong, from the MEP's independent experts office, said that while chlorothiazole is reportedly less poisonous than that of organophosphate pesticides, the toxicity of its ingredients, including chlorothiazole itself, has not been well-studied.
