Category:Privacy controversies and disputesQ: Get index position of an element in a sublist Suppose I have this example: (def a ("r" "r" "r" "g" "r" "r" "g" "r" "r")) How could I get the index of the "g" element in the a list so I can replace it with something else? I know how to do the second half, using the nth and replace functions, but not the first one. A: So you just want: (nth 1 a) ;;=> 2 If you need the string version of that: (format nil "~a" (nth 1 a)) ;;=> "g" If you don't need a string version, if you just want to replace the value: (assoc a 2) ;;=> "r" But, if you want to replace the value with something else, e.g. with the nth value on the second location, you can still use assoc and use nth, just remember it is a negative index, not a positive one: (assoc a -2 "bar") ;;=> "bar" You can also use assoc-in: (assoc-in a :test #'char-equal :test) ;;=> "r" For immutable values, there are a few things you can do. The usual approach is to use assoc-in and then get a reference to the old value that was replaced by that new value. Then just change the reference back to point to the old value. A: The nth function will work in conj
